

CVINGER

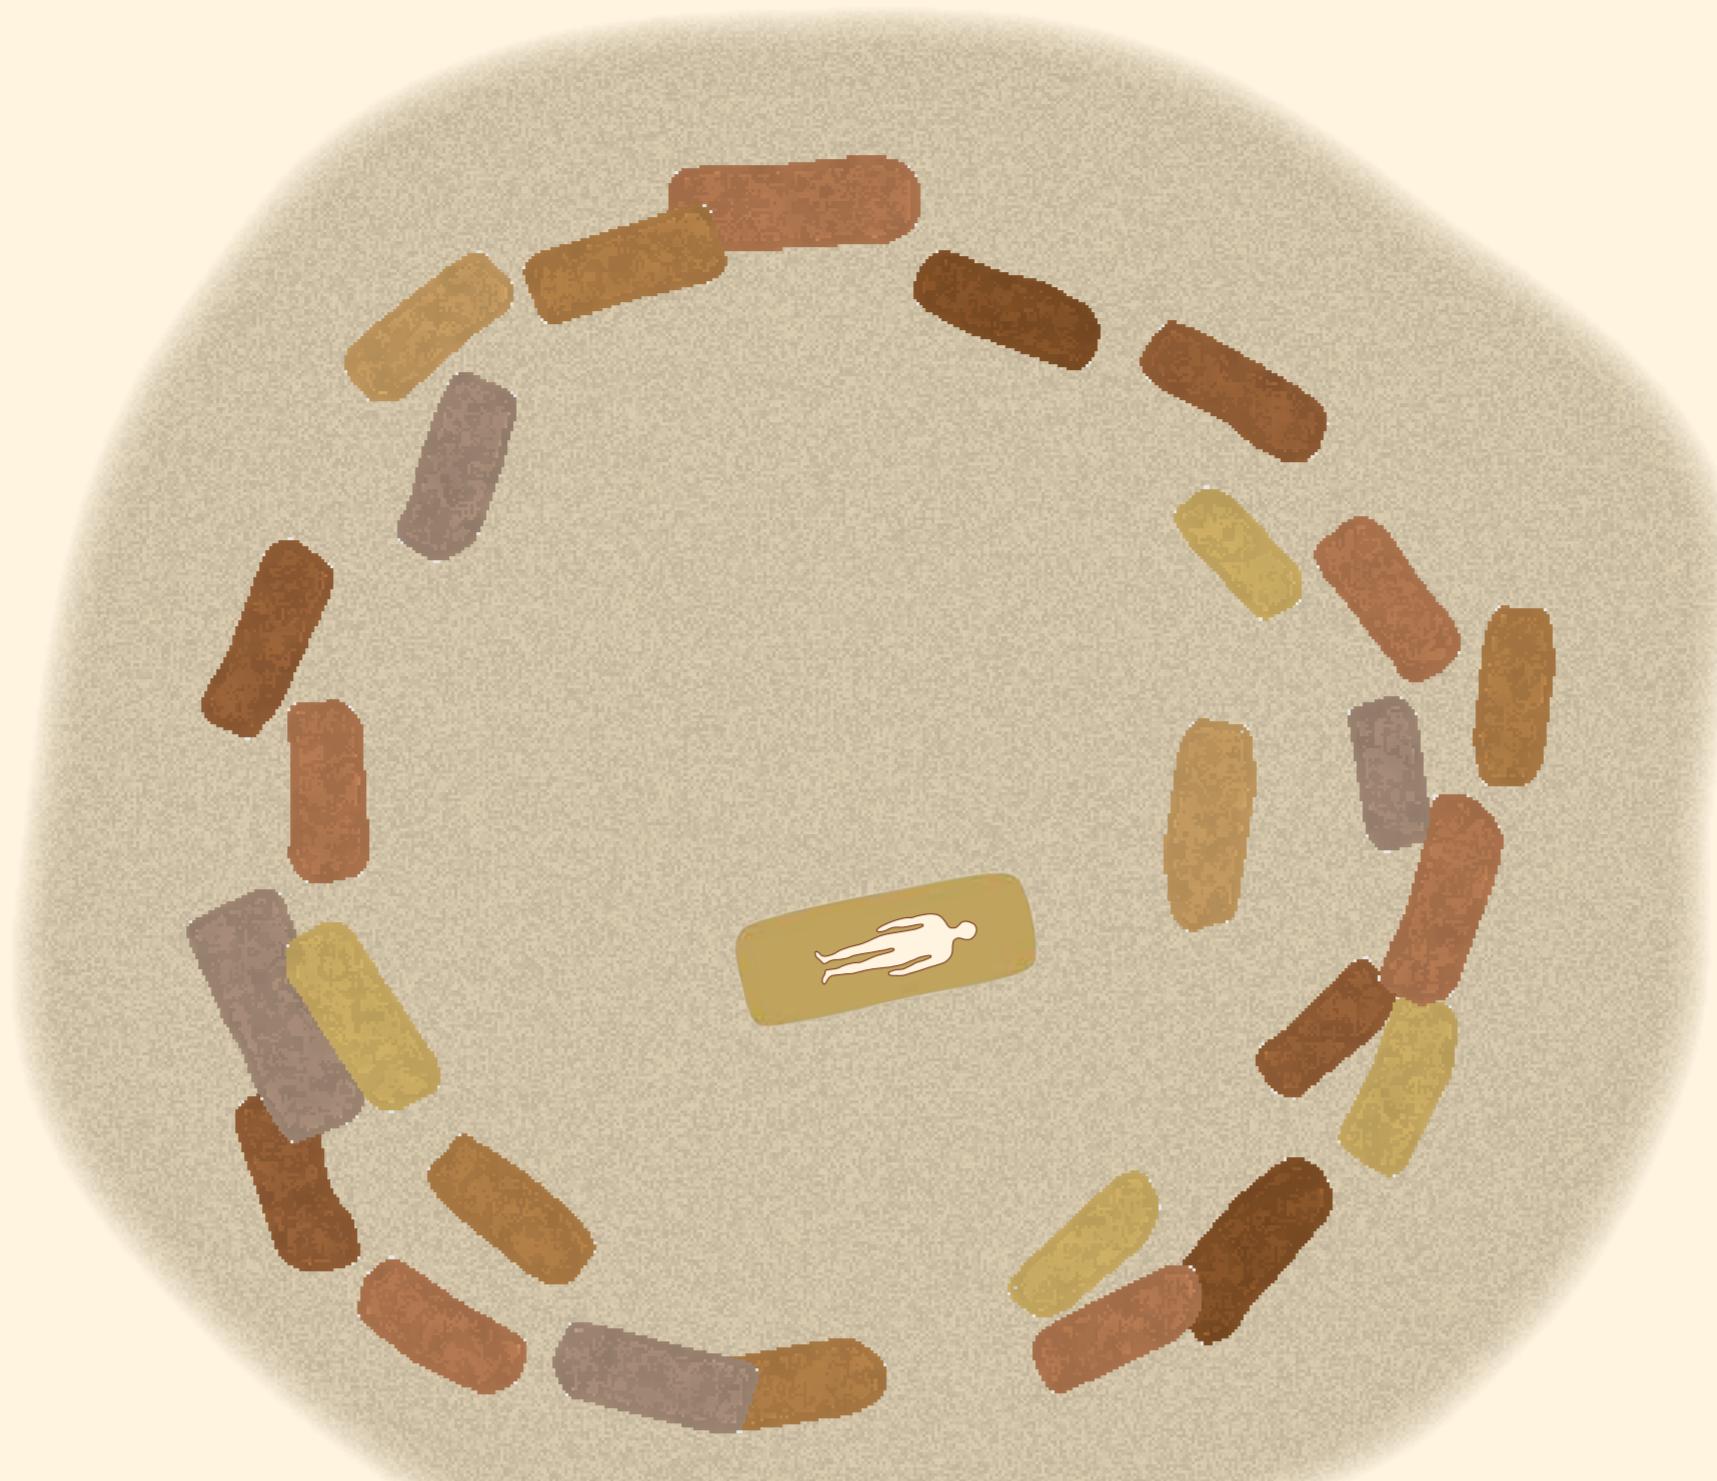

Gomilno grobišče

Prebivalci Cvingerja so svoje pokojnike pokopavali na treh gomilnih grobiščih v bližini, na ledini Gomivnica (SZ od naselja), pri Dolgih delih (SV od naselja) in na osrednjem grobišču na Branževcu, ki leži južno od naselja.

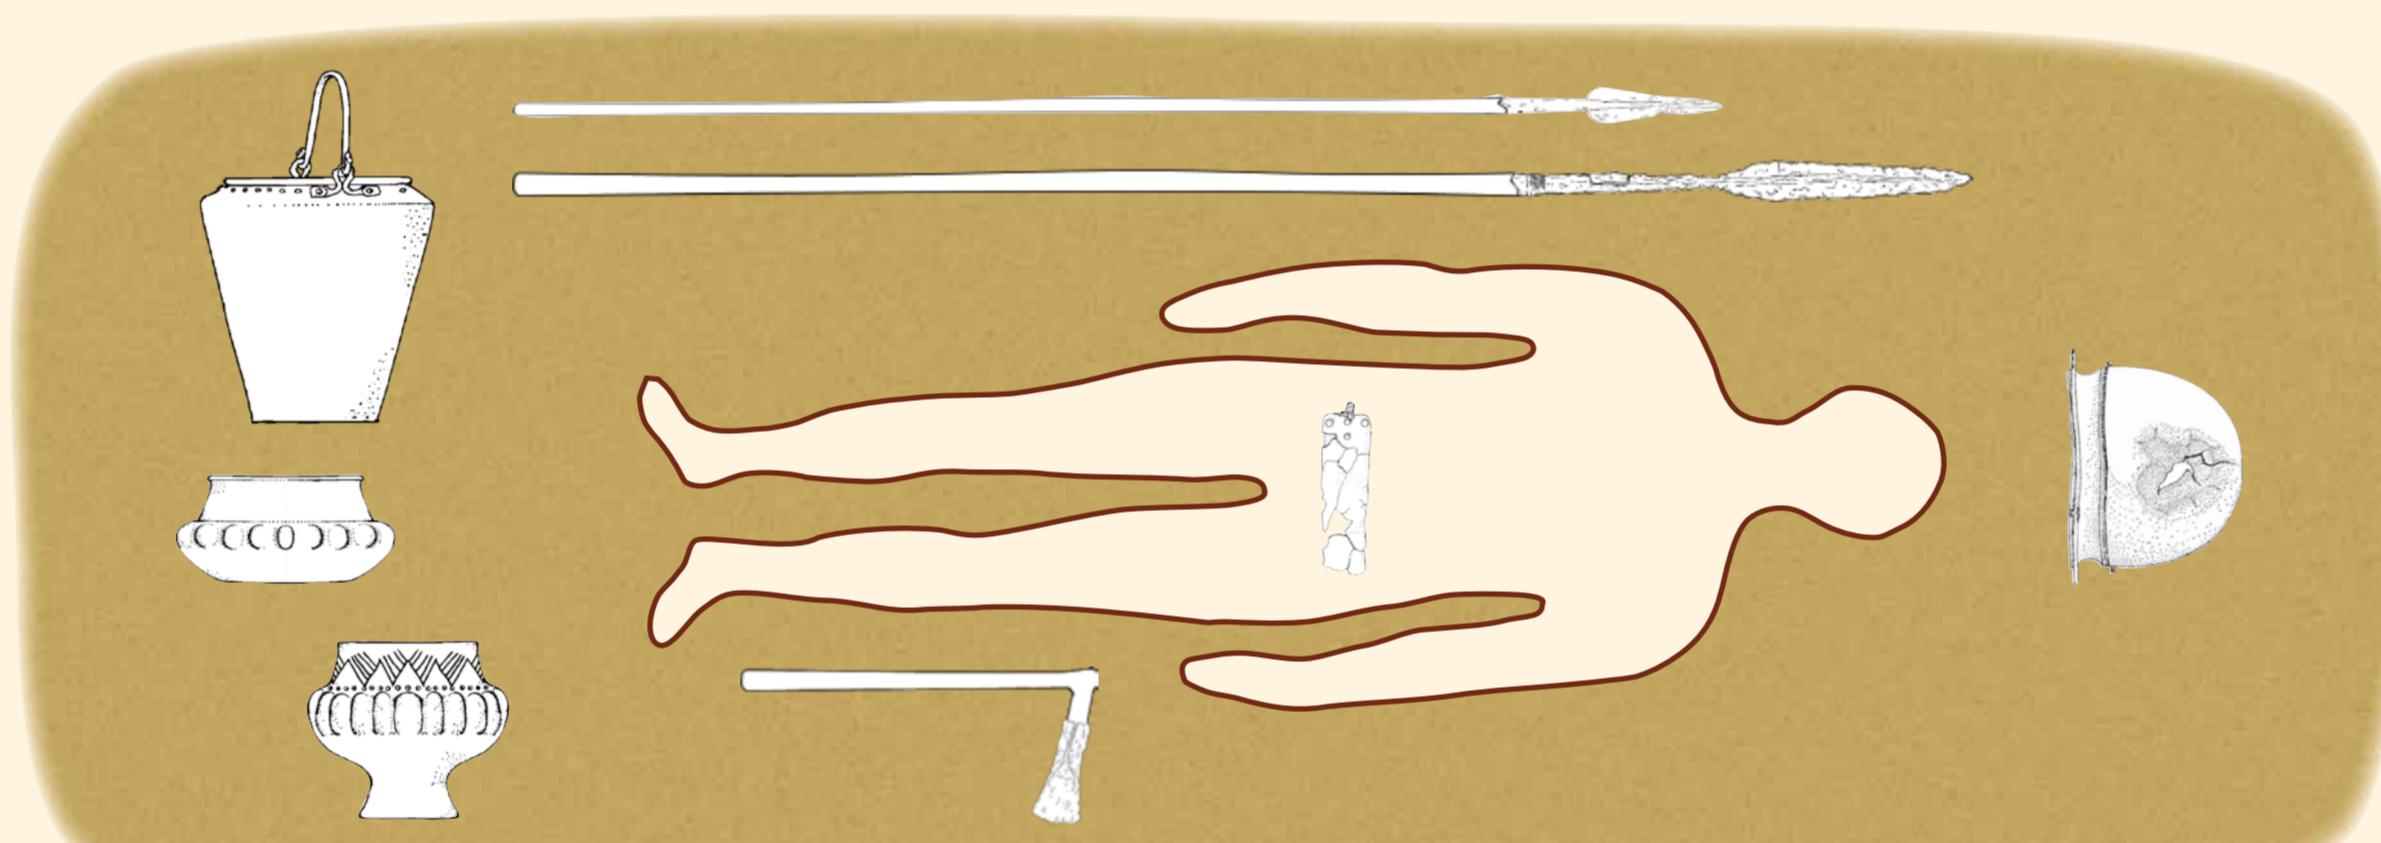

Osrednje gomilno grobišče šteje še 26 zemljenih gomil, v tlorisu okroglih kopastih reliefnih oblik s premerom 6 do 20 m. Ob nastanku so bile visoke nekaj metrov.

Grobovi so bili praviloma razpostavljeni v krogu po obodu gomil. V lesene krste so bili pokojnikom priloženi predmeti, ki naj bi jih potrebovali v posmrtnem življenu. To so bili njihovi posebni predmeti, kot so v ženskih grobovih predvsem bronast, steklen in jantarni nakit, v moških pa železno orodje in orožje. Praviloma je bilo zraven priloženo tudi lončeno in izjemoma bronasto posodje.

Posamezne gomile so lahko bile v uporabi tudi več stoljetij, zato domnevamo, da gre za rodovno–družinske gomile, ki jih je ena družina uporabljala več generacij.

The Barrow Cemetery

The inhabitants of Cvinger buried their dead in three barrow cemeteries in the surrounding area. These lay on the fields at Gomivnica (NW), on Dolgi deli (NE), and in the central barrow cemetery, which lay to the south of the settlement.

The main barrow cemetery comprised 26 earthen barrows visible. These are hemispherical structures with diameters ranging from 6 – 20 m. They were originally several metres in height.

The graves were arranged in a circle within the barrow. The deceased were placed in wooden coffins with the artefacts that they would require in the afterlife. These were bronze, glass and amber jewellery, which was generally found in female graves, whilst male graves usually contained iron tools and weapons. Both sexes were also accompanied by pottery and, exceptionally, bronze vessels.

Some of the barrows may have been used for several centuries. This has led to the suggestion that they were lineage or family barrows, which were used by one family for several generations.

Arheološke najdbe

Gomile je ob koncu 19. stol. kopal znani dolenjski starinokop Jernej Pečnik, dragocene najdbe pa hrani Prirodoslovni muzej na Dunaju. Prav te najdbe so bile več kot pol stoletja kasneje ključne za natančno časovno razdelitev in razumevanje družbenih procesov v 5. in 4. stol. pr. n. št.

V večini grobov je bilo odkrito raznoliko lončeno (risbe 1–4), v redkih pa še bronasto posodje (5–6). V moških grobovih velja ob prevladujočem železnem orodju ter orožju (7–8) izpostaviti še bronaste čelade (9). Tako za moško kot žensko kulturo oblačenja so bile značilne sponke oz. fibule (10–11). V ženskih grobovih so bili najdeni številni kosi nakita, kot so bronaste zapestnice, nanožnice (12), raznobarvne steklene in jantarne jagode, ki so bile nanizane v ogrlice (13–14), pa tudi keramična predilska vretenca (15).

Bogate najdbe nakazujejo blagostanje in trgovske povezave prebivalcev Cvingerja z ljudstvi z območij severne Italije, Alp, Panonske nižine in Balkana sredi 1. tisočletja pr. n. št.

Archaeological finds

The barrows were excavated at the end of the 19th century by the antiquarian Jernej Pečnik. The finds are now kept in the Natural History Museum in Vienna. These finds were a key element in the definition of chronology and in the understanding of social structure in the 5th and 4th century BC.

The majority of the graves contained a variety of pottery vessels (1–4), whilst few graves contain bronze vessels (5–6). Male burials are usually accompanied by iron tools and weapons (7–8), but only rarely by bronze helmets (9). Brooches were part of both male and female costume (10–11). Numerous pieces of jewellery are found in female burials. These include bronze bracelets and anklets (12), multi-coloured glass and amber bead necklaces (13–14), as well as pottery spindle whorls (15).

The rich finds bear witness to the prosperity and commercial contacts of Cvinger with communities in northern Italy, the Alps, Pannonia and the Balkans in the 1st millennium BC.
